

**PERMISSION TO DISTRIBUTE TRANSCRIPT DATA  
THROUGH TALKBANK  
Carnegie Mellon University**

Carnegie Mellon University is participating in a data-sharing program known as TalkBank that was established through federal and foundation grants to Brian MacWhinney at Carnegie Mellon. For the program to function properly, contributors will be asked to and will give permission for their work to be made available to other researchers. With a full understanding of the aforementioned, I hereby give permission to TalkBank to make and circulate electronic copies of the language transcripts and media that I describe below. These copies may be distributed to scholars and other responsible parties. I warrant that this use of the data is in accord with Human Subjects review procedures at my institution and that participants have given informed consent to have their data available to researchers. I also warrant that there is no copyright restriction over the transcripts and media being circulated. Any further restrictions that I wish to place on the use of these data are listed under (2) below. I do not hold Brian MacWhinney or Carnegie Mellon responsible for the enforcement of these further restrictions and indemnify and render harmless both Brian MacWhinney and Carnegie Mellon University against any actions at law or in equity or in similar courts of any jurisdictions arising from violations of these restrictions.

1. General description of the data set, and IRB Approval # (if available):

This data set consists of transcripts of language samples from a caregiver-mediated augmentative and alternative communication (AAC) intervention study conducted remotely from the city of Montreal, Canada. The study was approved by the McGill University Faculty of Medicine and Health Sciences IRB, protocol # A00-B81-20A.

The study was approximately 16 weeks in duration and included pre-intervention (two 5 minute-samples), mid-intervention (one 5-minute sample), and post-intervention (two 5-minute samples) data collection. The language samples that comprise this corpus were collected at all three time points. Language samples were transcribed from videos of five-minute interactions during which the caregiver and child participated in an activity of the caregiver's choosing. AAC devices were introduced through the intervention and were incorporated during the mid and post-intervention language samples.

2. Restrictions to be placed on the use of the data:

Corpus specific access. This level of access is used for most of the clinical corpora for which access is restricted to faculty, SLPs, or postdocs. Students must rely on their faculty advisors for access.
